

LONDON SEAGRASS

Seagrass grows under water; it is not just tropical but temperate too! It is the only flowering plant that grows in the marine environment, intertidal and subtidal, *Zostera Noltei* and *Zostera Marina*, in the UK.

Seagrass captures carbon, improves water quality, supports biodiversity, and provides essential nursery habitats for marine life for long-term resilience.

The current phase of the project is \$50,000
